

McMaster University Math 1A03  
Fall 2010 Midterm 1 October 7 2010 Duration: 90 minutes

Instructors: L. Barto, D. Haskell, J. Marikova

Name: SOLUTIONS

Student ID Number: \_\_\_\_\_

**Instructions**

- This test paper is printed on both sides of the page. There are 7 questions on pages 2 through 7; page 8 is blank for rough work. For full credit you must show all your work.
- You are responsible for ensuring that your copy of this test is complete. Bring any discrepancies to the attention of the invigilator.
- Only the McMaster standard calculator, the Casio fx , is permitted.
- Answers must be written in pen.

Problem	Points
1 [8]	
2 [8]	
3 [9]	
4 [8]	
5 [9]	
6 [4]	
7 [4]	
<b>Total [50]</b>	

1) [8 marks] No partial credit will be given on this question.

a) State the Riemann sum definition of the definite integral.

$$\int_a^b f(x) dx = \lim_{n \rightarrow \infty} \sum_{i=1}^n f(x_i^*) \Delta x,$$

where  $\Delta x = \frac{b-a}{n}$ ,  $x_i^*$  is a sample point in the interval  $[x_{i-1}, x_i]$ , and  $x_i = a + i\Delta x$

b)  $\int_4^9 f(x) dx = \lim_{n \rightarrow \infty} \sum_{i=1}^n \frac{5}{n} \left(4 + i \frac{5}{n}\right)^2$ . What is the function  $f(x)$ ?

$$f(x) = x^2$$

c) State Part I of the Fundamental Theorem of Calculus.

Let  $g(x)$  be the function defined on  $(a, b)$  by  $g(x) = \int_a^x f(t) dt$ . If  $f$  is continuous on  $[a, b]$  then  $g$  is differentiable and  $\frac{d}{dx} g(x) = f(x)$ .

d) For the function whose graph is shown, find  $\int_1^3 f(x) dx$ .

$$\begin{aligned} \int_1^3 f(x) dx &= \text{area } \square + \text{area } \triangle \\ &= 4 \times 1 + \frac{1}{2} \times 1 \times 4 \\ &= 6. \end{aligned}$$

2) [8 marks] No partial credit will be given on this question.

a) Find the derivative of  $f(x) = x^5 e^{2x}$  (do not simplify your answer).

$$f'(x) = 5x^4 e^{2x} + x^5 2e^{2x}$$

b) Find the derivative of  $g(t) = \sin(\sqrt{t})$  (do not simplify your answer).

$$g'(t) = \cos(\sqrt{t}) \cdot \frac{1}{2} t^{-1/2}$$

c) Find the derivative of  $f(x) = \frac{\cos(x)}{x^2 + 1}$  (do not simplify your answer).

$$f'(x) = \frac{(x^2 + 1)(-\sin(x)) - 2x \cos(x)}{(x^2 + 1)^2}$$

d) Let  $f(x) = g(h(x))$ . Suppose that  $g(0) = 1, g'(0) = -1, g(5) = 7, g'(5) = 10, h(0) = 5, h'(0) = -2$ . Find  $f'(0)$ .

$$f'(x) = g'(h(x)) h'(x)$$

$$f'(0) = g'(h(0)) h'(0)$$

$$= g'(5) (-2)$$

$$= 10 \times (-2)$$

$$= -20$$

3) [9 marks] Consider the following table of velocity/time data over a period of one minute. Assume that the velocity function is increasing over this time.

time in seconds	0	10	20	30	40	50	60
velocity in meters per second	0	1	3	4	6	9	12

a) Sketch a graph of  $y = v(t)$ .

b) Using left endpoints of ten-second intervals, estimate the distance travelled during this minute. State whether your estimate is too high or too low for the actual distance travelled, and explain your reasoning.

$$L_6 = 0 \times 10 + 1 \times 10 + 3 \times 10 + 4 \times 10 + 6 \times 10 + 9 \times 10$$

$$= 230$$

the estimate is too low, because the function is increasing, so the area of the rectangles lie below the graph.

c) Using the given data, calculate a better estimate of the distance travelled. Justify that your method is an improvement.

Calculate  $R_6$ , take  $\frac{1}{2}(L_6 + R_6)$ .

$R_6$  ~~too~~ is too large, so the exact value is somewhere in-between =

Or the midpoint rule with 3 intervals. This is a better estimate, as the additional area added in or on the left of each sample point is compensated for by the area left out to the right of the sample point.

4) [8 marks] Find the general form of the following indefinite integrals.

a)  $\int e^x \cos(e^x) dx$

$$\text{let } u = e^x$$

$$du = e^x dx$$

$$\int e^x \cos(e^x) dx = \int \cos(u) du$$

$$= \sin(u) + C$$

$$= \sin(e^x) + C$$

b)  $\int (x^2 - 3)\sqrt{x^3 - 9x} dx$

$$\text{let } u = x^3 - 9x$$

$$du = (3x^2 - 9) dx$$

$$= 3(x^2 - 3) dx$$

$$\frac{1}{3} du = (x^2 - 3) dx$$

$$\int (x^2 - 3)\sqrt{x^3 - 9x} dx = \int \frac{1}{3} \sqrt{u} du$$

$$= \frac{1}{3} \cdot \frac{2}{3} u^{3/2} + C$$

$$= \frac{2}{9} (x^3 - 9x)^{3/2} + C$$

5) [9 marks] Find the following definite integrals.

a)  $\int_{-\pi}^0 \sin(x) dx$

$$= \left[ -\cos(x) \right]_{-\pi}^0$$

$$= -\cos(0) - (-\cos(-\pi))$$

$$= -1 - (-1)$$

$$= 0$$

b)  $\int_{-1}^1 e^{2x} dx$

$$= \left[ \frac{1}{2} e^{2x} \right]_{-1}^1$$

$$= \frac{1}{2} \left( e^2 - \frac{1}{e^2} \right)$$

or

let  $u = 2x$

$du = 2 dx$

when  $x = -1$ ,  $u = -2$

$x = 1$ ,  $u = 2$

$$\int_{-1}^1 e^{2x} dx = \int_{-2}^2 \frac{1}{2} e^u du$$

$$= \left[ \frac{1}{2} e^u \right]_{-2}^2 = \frac{1}{2} (e^2 - e^{-2})$$

c)  $\int_{-3}^3 x(x^2 - 9) dx$

$$= \int_{-3}^3 (x^3 - 9x) dx$$

$$= \left[ \frac{1}{4} x^4 - \frac{9}{2} x^2 \right]_{-3}^3$$

$$= \frac{1}{4} 3^4 - \frac{9}{2} 3^2 - \left( \frac{1}{4} (-3)^4 - \frac{9}{2} (-3)^2 \right)$$

$$= 0$$

or

$$\int_{-3}^3 x(x^2 - 9) dx = 0$$

6) [4 marks] You decide to plant a bamboo from seed and keep it in your room. Assume that the bamboo grows at a rate of  $\frac{3}{2}\sqrt{t}$  meters per year. After how many years will it reach the 8 foot high ceiling?

Let  $h(t) =$  height of bamboo after  $t$  years.  $T^{3/2} - 0^{3/2} = 8$   
 $h'(t) = \frac{3}{2}\sqrt{t}$ .  $T = 4$   
 Find  $T$  so that  
 $h(T) = 8$ . That is,  $\int_0^T \frac{3}{2}\sqrt{t} dt = 8$   
 $\left[ \frac{3}{2} \cdot \frac{2}{3} t^{3/2} \right]_0^T = 8$

7) [4 marks] (a) On the axes given, sketch the graph of a continuous function  $f$  with the property that  $L_2$  is a better estimate for  $A = \int_2^6 f(x) dx$  than  $L_4$ , where  $L_n$  denotes the approximation of  $A$  using  $n$  intervals of equal width and left endpoints.

$$L_2 = 2 \times (f(2) + f(4))$$

$$L_4 = 4 \times (f(2) + f(3) + f(4) + f(5))$$

(b) Is it possible to have a function as in (a) which is increasing?

The above example works because  $f(3)$  is much smaller than  $f(2)$  and  $f(4)$ , so is a poor estimate to the other values of the function  $f(x)$  for  $2 < x < 4$ . This is not possible with an increasing function, as  $f(2) < f(3) < f(4)$ , so  $f(3)$  is a better approximation to the values of the function for  $2 < x < 4$ .

(1) (a) You decide to plant a banana from seed and keep it in your room. Assume that the banana grows at a rate of  $\frac{1}{2}$  inches per year. After how many years will it reach the 8 foot high ceiling?

Let  $h(t) =$  height of banana after  $t$  years

Find  $T =$  when  $h(T) = 8$

$$h'(t) = \frac{1}{2}$$

$$h(t) = \int \frac{1}{2} dt = \frac{1}{2}t + C$$

At  $t=0$ ,  $h(0) = 0$

$$0 = \frac{1}{2}(0) + C \implies C = 0$$

$$h(t) = \frac{1}{2}t$$

Set  $h(T) = 8$

$$8 = \frac{1}{2}T \implies T = 16$$

(2) (a) On the axes given, sketch the graph of a continuous function  $f$  with the property that  $f$  is a better estimator for  $A = \int_0^1 f(x) dx$  than  $L_2$  denotes the approximation of  $A$  using a interval of equal width and left endpoints.

$L_2 = 2 \times (f(0) + f(1)) \times 0.5 = 2 \times (1 + 1) \times 0.5 = 2$

$L_4 = 4 \times (f(0) + f(0.25) + f(0.5) + f(0.75) + f(1)) \times 0.25 = 4 \times (1 + 1.25 + 1.5 + 1.75 + 2) \times 0.25 = 4 \times 7.5 \times 0.25 = 7.5$

(b) Is it possible to have a function  $f$  on  $[0,1]$  which is increasing and concave down such that  $f(0) = 1$  and  $f(1) = 2$  and  $L_2$  is a better estimator for  $A = \int_0^1 f(x) dx$  than  $L_4$  denotes the approximation of  $A$  using a interval of equal width and left endpoints?

The above example was chosen  $f(x) = 1 + 2x^2$  and we can see that  $f(0) = 1$  and  $f(1) = 2$ , and  $L_2 = 2$  and  $L_4 = 7.5$ . This is not possible with an increasing function, as  $f(0.25) < f(0.5) < f(0.75)$ , and  $f(0.25) < f(0.5) < f(0.75) < f(1)$  is a better approximation to the value of the function  $f$  on  $[0,1]$ .
